

VELA Seating ensures people with restricted growth are not restricted in life.

“Unlike many seats on wheels, a VELA seat allows a person to use the seat completely independently. The braking system can be operated by the user whilst seated. The High – low controls are positioned to enable independent access in daily life.

Children and young people with achondroplasia have benefited from VELA seats in more ways than one. They are able to participate in everyday activities within the classroom, the dining hall and Science labs independently.

The seat is discreet and because of its technology has a degree of kudos which can appeal to young people.”

ergonomics  101

The VELA activity chair makes every day tasks easier.

An activity chair from VELA can help children and young people get a better everyday life at home. In short, the proper paediatric seating can help to ensure that there is enough energy for homework, seated leisure activities and also for spending time with the family.

Adaptive seating makes a big difference for children with or without additional needs

A good sitting position is a prerequisite for good learning of mental and motor skills for all children. And in learning situations, a good sitting position is crucial.

Adaptive seating for additional needs in a VELA chair that follows ergonomic principles enables movement and flexibility while a good sitting position can prevent tension and stress – which is a growing problem for children and young people in school.

Children who have problems with balance and moving can have a much better life if they have the proper paediatric seating.

An activity chair from VELA can help children to concentrate on what is essential and what interests them, such as playing and forming friendships.

A chair from VELA can relieve pain and ensure that the child receives the support they need to function well in everyday life.

Calmness and concentration with paediatric seating

The chair supports learning and concentration as it “encircles” the child with the help of supportive paediatric seating, backrest, armrests and footplate, thus promoting calm and concentration.

Ergonomics are important

You can adjust the seat height to fit the table height, so you do not need to change how the child sits to get higher up. In that way, the child has an ergonomic sitting position with relaxed shoulders and arms. In addition, the chair’s footplate is raised and lowered along with the chair’s seat, meaning that the footplate provides good grounding at all times.

Children are different – get the right accessories for your paediatric activity chairs

Children are all different, and so are the consequences of a disability. Therefore, various accessories can make the VELA chairs into optimal paediatric activity chairs for your children. In addition, the right accessories can help create good conditions for activity and participation in social life and family life.

Sit well in an additional needs chair for better learning in the classroom

Going to school is demanding for all children and young people, not least for children and young people with physical or mental disabilities. The child must sit still for a long time, do schoolwork and concentrate. An additional needs chair at the classroom desk helps the child better find calm, pay attention and focus. The proper additional needs chair provides the best possible basis for the child’s learning and participation in the classroom.

Paediatric seating: A VELA chair can grow with the child

It is possible to replace both the seat and the backrest on the chair, which means that the chair can grow with the child and provide adaptive paediatric seating for your child on an ongoing basis. Because the chair can “grow” with the child, it has a long life and can support the child for many years.

Paediatric activity chairs from VELA can help your child in the following ways:

Support and comfort

An ergonomic chair with paediatric seating ensures good support and comfort. Support and comfort are essential because children often need to spend many hours in an activity chair. This chair allows the child to sit comfortably and correctly for many hours at a time.

Safety and security

Paediatric activity chairs from VELA provides safety and security throughout the day – for both homework and meals. The chair has an easily accessible handbrake for seated activities, and it is safe to get up from and sit down in the chair.

Easy-access up/down function

The child can easily change the seat height up/down to suit different table heights or activities by a simple press of a button.

Adjust the chair as needed

You can easily adjust the chair’s height to suit the table at which the child sits, whether it is a desk in their room or the dining table in the kitchen. In that way, the child can participate in everyday life with family and friends.

Greater independence

The child can get in and out of the chair using the electric seat lift, which means greater independence. The electric seat lift also provides an opportunity for them to be at eye level with other children, thus allowing equal interaction and conversation.

Just stay seated

It is easy to help the child get around safely and calmly, e.g. up to the blackboard or another classroom.
